Purpose Statement

- ▶ Annual members are more profitable than casual riders.
- ▶ How do casual riders and annual members use Cyclistic bikes differently, and what should Cyclistic do to convert more casual riders into members?

Tell Your Story

- ▶ Data source: 2025 Divvy trip data
- ▶ Records analyzed: approximately 5.4 million rides after cleaning
- ▶ Time period: January-December 2025
- ▶ Key variables: rider type, ride duration, bike type, station locations, ride start/end timestamps
- ▶ Tools: BigQuery SQL for cleaning and analysis, Tableau for visualization
- ▶ Limitations: the data is anonymized, so recommendations are based on riding behavior, not demographics.

Finding 1: Members Account for More Total Rides

- Members represent the stronger routine-use group. This suggests that membership is associated with more frequent bike usage.

Finding 2: Casual Riders Take Longer Average Trips

- ▶ Casual riders appear to use bikes more for leisure or destination-based trips, while members may use them for shorter, practical transportation.

Finding 3: Members Show Routine Patterns; Casual Riders Skew Recreationally

- Members show stronger weekday and commute hour usage, while casual riders may be more active on weekends or later in the day.

Finding 4: Casual Ridership Peaks More Strongly in Warmer Months

- ▶ Ridership increases during spring and summer.
- ▶ Casual ridership shows stronger seasonality.
- ▶ If casual riders increase sharply in spring and summer, Cyclistic should begin conversion campaigns before peak casual rider season.

Finding 5: Casual-Heavy Stations Reveal Targeting Opportunities

- ▶ Casual riders frequently start rides from lakefront and tourist adjacent stations.
- ▶ Stations with high casual rider concentration are strong places for targeted promotions, station signage, QR codes, and in app membership offers.

Conclusion

- ▶ Casual riders and annual members use Cyclistic differently. Members appear more routine oriented, while casual riders show stronger leisure, weekend, seasonal, and location-based patterns.
- ▶ Recommendations
 - ▶ Target casual riders in spring before summer usage increases.
 - ▶ Message the annual membership as a better value for casual riders who already take longer or repeated trips.
 - ▶ Focus ads around tourist, leisure, lakefront, park, and entertainment heavy stations.
- ▶ Next steps
 - ▶ Collect and analyze customer-level usage, pricing, and marketing attribution data
 - ▶ Test campaign performance
